Germination Codes

- * seed is hydrophylllic, intolerant of dry storage.
- A seed will germinate within 4 weeks if sown at 20°C
- B seed will germinate upon being shifted to 20°C after a period of moist, cold stratification at 5°C.
- C seed germinates only after multiple cycles of warm and cold, typically 5°-20°-5°-20°C.
- D seed needs a period of warm, moist stratification followed by cold stratification and will germinate after being shifted back to warm, for example 20°-5°-20°C.
- G seed will not germinate in presence of chemical inhibitors.
- H seed requires light to germinate.
- I seed requires scarification because of an impermeable seed coat.
- J seed needs high humidity to germinate
- K seed germinates better with innoculant
- M moss germination: seed germinates best in the presence of both light and high atmospheric moisture as would be found on a damp mossy substrate in the wild.
- W wetland species: soil should be consistently wet
